

Spoofing cyber security

Spoofing cyber security:

In cybersecurity, 'spoofing' is **when fraudsters pretend to be someone or something else to win a person's trust**. The motivation is usually to gain access to systems, steal data, steal money, or spread malware.

For example, **when a caller on the other end falsely introduces themselves as a representative of your bank and asks for your account or credit card info**, you are a victim of phone spoofing.

Types of spoofing attacks

- Email Spoofing. One of the most common types of spoofing attacks is email spoofing.
- Caller ID Spoofing.
- Website or Domain Spoofing.
- IP Spoofing.
- Address Resolution Protocol (ARP) Spoofing.
- GPS spoofing.
- Man-in-the-middle (MitM) attack.
- Facial spoofing.
