

Tormac Website Investigation Report

Introduction

Following the reported website accessibility issue, a detailed technical investigation was conducted to determine the cause of intermittent access experienced by users in certain countries. It was also reported that some users were being redirected to the domestic website instead of the international website.

The objective of this investigation was to verify whether the issue originated from the hosting server, DNS configuration, website infrastructure, or any external network components. A comprehensive analysis was carried out covering server health, resource utilization, DNS resolution, hosting environment, and regional website accessibility to identify the root cause and validate the overall stability of the hosting infrastructure.

Scope of Investigation

The following technical areas were verified:

- Server Resource Monitoring
- DNS Resolution Verification
- Hosting Provider Investigation
- Website Accessibility Testing
- Regional Access Validation
- Root Cause Analysis

Server Health Analysis

Observation

Continuous monitoring confirmed that the hosting server remained healthy throughout the investigation period.

Verified Parameters

- CPU Usage – Stable
- Memory Usage – Normal
- Disk Usage – Within Limits
- PHP Workers – No Saturation
- I/O Performance – Normal
- Running Processes – Stable

Result

No server overload

No hosting resource bottleneck

Infrastructure remained stable throughout the monitoring period.

DNS Verification

Checks Performed

- Global DNS Resolution
- Cloudflare Nameserver Validation
- DNS Propagation Verification
- International DNS Lookup

Result

- DNS resolved successfully worldwide.
- No propagation delays observed.
- DNS configuration functioning correctly.

CHECK DNS

tormacpumps.com		NS	Search
CD Flag		☐ Refresh: 20 sec.	
Mountain View CA, United States Google	woz.ns.cloudflare.com. jo.ns.cloudflare.com.		
Berkeley, US Quad9	woz.ns.cloudflare.com. jo.ns.cloudflare.com.		
San Francisco CA, United States OpenDNS	jo.ns.cloudflare.com. woz.ns.cloudflare.com.		
Wilmington, United States of America NextDNS Inc.	jo.ns.cloudflare.com. woz.ns.cloudflare.com.		
San Francisco, US Quad9	jo.ns.cloudflare.com. woz.ns.cloudflare.com.		
United States —	woz.ns.cloudflare.com. jo.ns.cloudflare.com.		

Hosting Provider Findings

Hostinger Support independently verified the server status.

- Website accessible from hosting infrastructure
- No server abnormalities detected
- Origin server functioning normally

Technical Observation

Since the website uses Cloudflare DNS, the intermittent regional accessibility is more likely related to:

- Cloudflare Cache
- Edge Routing
- Proxy Configuration
- CDN Behaviour

Screenshot ref from server provider

Petra

I've checked the site from my end and it is loading correctly, though I see the inconsistencies you're pointing out in different regions :

Since your domain is using **Cloudflare**, these varying errors across different locations usually point to a caching issue or a configuration conflict there. Have you had a chance to follow the guide I shared earlier to **clear your Cloudflare cache**?

If the issue persists after clearing the cache, please try **pausing Cloudflare** temporarily. This will allow the site to load directly from our servers so we can confirm if the database and connection are stable globally without the proxy in the middle.

Regional Website Verification

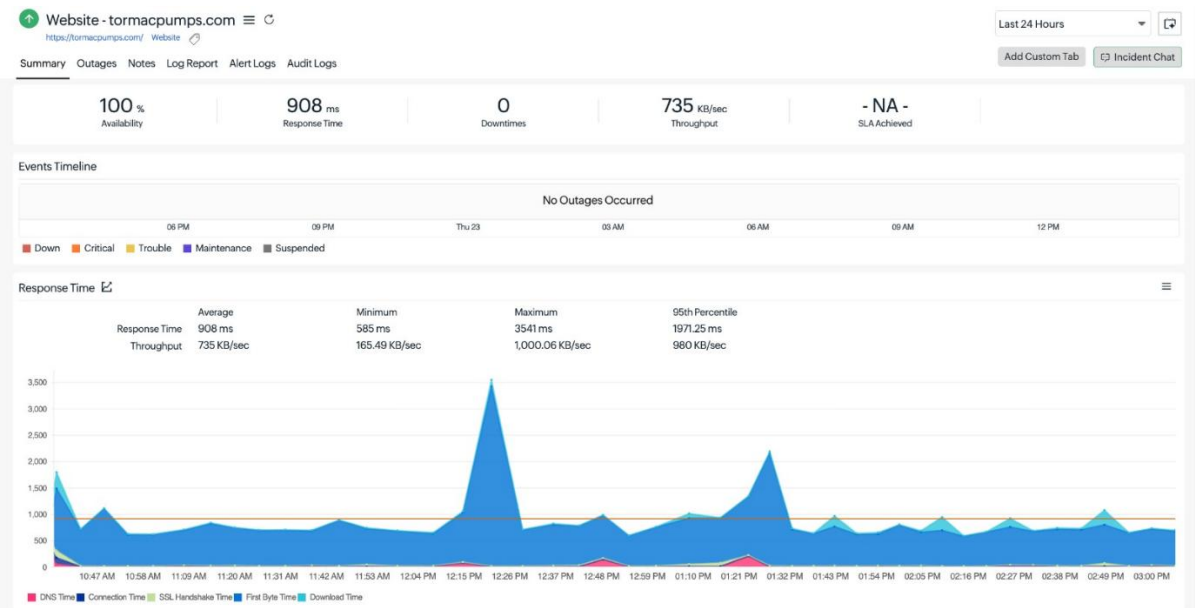

Website accessibility was successfully validated from multiple international locations.

Countries tested include:

- Germany
- France
- Saudi Arabia

The website loaded successfully during testing, confirming that the origin server was responding correctly. The screenshots included in the report provide supporting evidence of these successful tests.

Component	Status
Hosting Server	✔ Healthy
CPU & Memory	✔ Healthy
Disk Usage	✔ Healthy
DNS Resolution	✔ Working
Server Availability	✔ Confirmed
Cloudflare DNS	Requires Further Investigation

Investigation Outcome

Our investigation did not identify any issues related to the hosting server or website infrastructure.

Key findings:

- Server resources remained stable throughout the monitoring period.
- DNS resolution was successful across global locations.
- Hostinger confirmed that the origin server was operating normally.

- Website accessibility issues appear to be related to Cloudflare's caching, CDN routing, or proxy configuration rather than the hosting environment.
- Supporting screenshots have been included as evidence for all verification activities.

Conclusion

Based on the technical investigation conducted over seven days, no issues were identified on the hosting server or infrastructure from our end. The evidence collected indicates that the server remained healthy and operational throughout the monitoring period. Any intermittent website accessibility observed in specific regions is likely associated with Cloudflare's CDN or proxy layer and should be investigated further at the Cloudflare level. Supporting screenshots are attached in the report for reference.
